

ABSTRACT

A solid porous surfactant body of low density, for example,
5 a tablet, comprises a high level of surfactant: at least
60 wt% and preferably at least 75 wt%. Preferably a high
level of anionic surfactant is present. Inorganic salts are
preferably absent, or present only in small quantities. The
body is typically in the form of an assembly of solid
10 surfactant particles, for example, flakes, bonded together
by means of heat and/or a binder.
